

Patterson Whittaker Architectural Profiles

MAINTENANCE GUIDELINES

PW materials are remarkably durable and require very little maintenance.

Please observe the following guidelines when caring for your architectural details:

PW STONE FINISH PRODUCTS

Remove surface scuff marks by spot cleaning with biodegradable soap and a stiff nylon brush.

Periodically inspect materials to ensure all sealant and grout joints are intact; repair as required.

PW PAINT GRADE PRODUCTS

Because our paint grade products contain a special formulation that creates an actual chemical bond with acrylic-based paints, PW materials can provide years of added life over typical painted wood trim applications.

PW paint grade materials should be cleaned in the same way as any painted surface, which is generally with a cloth or soft brush and biodegradable soap.

IMPORTANT PRECAUTIONS

Never clean PW materials with a pressure washer.

Avoid contact between PW products and stains, grease, oils, and solvents of any kind.

PW profiles are non-structural. Do not attach objects to our products. This includes securing hardware or other materials by screwing into or bolting onto the shapes.

Take care to maintain all weather-resistant sealant joints along the top horizontal edge of exterior profiles. In order to maintain a proper pathway for water and moisture escape, NEVER seal the bottom edge of any PW profile.
